

DOORGRAB

Landing Page & Waitlist MVP Developer Requirements for Frontend + Backend

v0.1 · WAITLIST-FIRST · NO WHATSAPP ORDERING

Document Type	MVP Requirements – Landing Page & Waitlist
Audience	Frontend (Next.js) · Backend (Node.js + Express)
Primary Goal	Capture waitlist leads. No live ordering in this phase.
Market	Sokoto, Nigeria (pilot city)
Date	3 August 2026
Status	Ready for development

This document defines the exact scope for the current public-facing website. WhatsApp ordering is removed as a primary action. The site becomes a marketing + waitlist experience while the full food-delivery app is being built.

1. Goal of this MVP

Launch a clean, professional marketing website for DoorGrab that:

- Explains what DoorGrab is and the future vision (food + more)
- Clearly communicates that the full app is coming soon
- Captures high-quality waitlist leads (name, email, phone)
- Removes WhatsApp as the primary order channel
- Builds trust (CAC registered, local, safe, fast)
- Collects interest from potential restaurants and riders (optional secondary forms)

Out of scope for this MVP: Live ordering, rider assignment, payment processing, real-time tracking, restaurant dashboards, or any transactional flow.

2. Key Product Decision

Previous Approach	New Approach (This MVP)
Primary CTA = “Order on WhatsApp”	Primary CTA = “Join the Waitlist”
Users can place orders immediately via chat	No live ordering. App is coming soon.
WhatsApp as main channel	WhatsApp kept only as secondary support contact
Mixed messaging (order now + waitlist)	Single clear message: Join waitlist for early access

3. Site Structure (Pages & Sections)

3.1 Single-page marketing site (recommended for speed)

One long scrolling page with clear section anchors. Navigation links scroll to sections. This is fastest to ship and best for conversion at this stage.

#	Section	Purpose	Key Elements
1	Hero	First impression + primary CTA	Headline, subtext, “Join Waitlist” button, secondary “Learn more”
2	About	Who we are + why Sokoto	Mission, vision, 4 trust pillars
3	What we will deliver	Future services overview	Food (featured), Parcels, Pharmacy, Groceries, Boutique, Business
4	How it will work	Simple 4-step future flow	Place order → Rider assigned → Pickup → Delivered
5	Why DoorGrab	Differentiators	Fast, Verified riders, Flexible pay, Local, Always available
6	Coverage	Where we launch	Sokoto live soon, coming cities, map or list of areas
7	Waitlist CTA	Main conversion block	Form: Full name, Email, Phone (optional). Benefits list.
8	FAQ	Handle objections	Accordion. 6–8 common questions.
9	Contact	Support channel	Email, WhatsApp (support only), location
10	Footer	Legal + links	Links, privacy, terms, © 2026

4. Recommended Hero Copy

Headline options (pick one):

- Sokoto’s all-in-one delivery platform is coming
- Food, parcels & more — delivered fast in Sokoto

- Get ready. DoorGrab is launching in Sokoto.

Sub-headline: Join the waitlist for early access to the DoorGrab app. Be first to order food, send parcels, and more — right here in Sokoto.

Primary button: Join the Waitlist

Secondary button: Learn more (scrolls to About or How it works)

5. Waitlist Form Specification

5.1 Fields

Field	Type	Required	Validation
Full Name	text	Yes	Min 2 characters
Email	email	Yes	Valid email format
Phone Number	tel	Optional (recommended)	Nigerian format preferred (+234...)
Interest (optional)	select / multi	No	Customer / Restaurant / Rider

5.2 Success behaviour

- Show clear success message: “You’re on the list! We’ll notify you when we launch.”
- Optionally show a WhatsApp support link as secondary action
- Do not redirect away from the page (keep user on site)
- Disable submit button while request is in flight
- Show inline error messages on validation failure

5.3 Backend requirements

- POST /api/waitlist – create new lead
- Store: name, email, phone, interest, created_at, source (landing), user_agent
- Prevent duplicate emails (return 200 + friendly message if already exists)
- Optional: send confirmation email (or queue for later)
- Admin endpoint or simple dashboard later to export leads (CSV)

6. What to Remove / Change from Current Site

Element	Action	Reason
“Order on WhatsApp” primary buttons	Remove or demote	Conflicts with waitlist message
“Order now” / “Get your Parcels delivered fast” as live promise	Rewrite to future tense	We are not live yet
Live ordering instructions via WhatsApp	Remove from How it works	How it works should describe the future app
“No app needed right now” messaging	Replace	New message: App is coming — join waitlist
Contact form that opens WhatsApp for orders	Change to support-only	WhatsApp remains for questions, not orders

7. Technical Requirements

7.1 Frontend (Next.js)

- Framework: Next.js (App Router preferred)
- Styling: Tailwind CSS (or existing design system)
- Responsive: Mobile-first (majority of Sokoto users are on mobile)
- SEO: Proper meta title, description, Open Graph tags
- Performance: Fast LCP, minimal JS on first load
- Forms: Client-side validation + server action or API call
- Analytics: Basic event tracking (waitlist submit, section views) — optional but recommended

7.2 Backend (Node.js + Express)

- Runtime: Node.js + Express
- Database: PostgreSQL (waitlist_leads table)
- Validation: Zod or Joi on incoming payload
- Rate limiting on /api/waitlist to prevent spam
- CORS configured for the frontend domain
- Environment variables for DB connection and any email service
- Simple health check endpoint

7.3 Suggested Database Schema (waitlist)

id UUID PRIMARY KEY
full_name VARCHAR(150) NOT NULL
email VARCHAR(255) NOT NULL UNIQUE
phone VARCHAR(30)
interest VARCHAR(50) -- customer | restaurant | rider | null
source VARCHAR(50) DEFAULT 'landing'
user_agent TEXT
created_at TIMESTAMPTZ DEFAULT NOW()
notified_at TIMESTAMPTZ -- when we later send launch email

8. API Contract (Waitlist)

POST /api/waitlist

Request body

```
{ "fullName": "string", "email": "string", "phone": "string?", "interest": "string?" }
```

Success (201 or 200)

```
{ "success": true, "message": "You're on the waitlist!" }
```

Already exists (200)

```
{ "success": true, "message": "You're already on the list. We'll notify you at launch." }
```

Validation error (400)

```
{ "success": false, "errors": { "email": "Invalid email" } }
```

9. Acceptance Criteria

Frontend

- Site loads cleanly on mobile and desktop
- Primary CTA on every major section is "Join the Waitlist"
- No "Order on WhatsApp" buttons as primary actions
- Waitlist form validates required fields client-side
- Success and error states are clear and accessible
- All section navigation works (smooth scroll or proper anchors)

- Page is indexable (basic SEO tags present)

Backend

- POST /api/waitlist accepts valid payload and stores the lead
- Duplicate email is handled gracefully (no crash, friendly message)
- Invalid data returns 400 with useful error details
- Rate limiting prevents basic spam
- Leads can be queried/exported later by admin (even if via DB for now)

10. Success Metrics (First 30-60 days)

Metric	Target	Why it matters
Waitlist sign-ups	500+	Demand signal before building full app
Email open rate (later)	> 40%	Quality of the list
Restaurant interest	15+	Supply side readiness
Rider interest	30+	Delivery capacity readiness

11. Relationship to Full Product PRD

This Landing Page + Waitlist MVP is v0.1 in the larger product roadmap. The full Food Delivery PRD (v1.0) remains the source of truth for the actual ordering product (Customer app, Rider app, Restaurant dashboard, Admin, Node.js + Express backend, Paystack + Flutterwave, etc.).

Once waitlist traction is proven, development continues on the full food-delivery MVP exactly as defined in the main PRD.
